MRI systems designed to improve the patient experience.

The Atlas SPEEDER head coil is designed to improve the MRI experience for patients that may be claustrophobic. Our MRI systems also offer many other features to increase patient comfort and operational workflow without compromising image quality.

PIANISSIMO™ NOISE REDUCTION TECHNOLOGY
Utilizes a combination of techniques to reduce noise levels up to 90% and increase patient comfort during scanning procedures.

ULTRA-SHORT OPEN BORE
The Vantage Titan’s 71 cm bore provides more room for patients, is less restricting and more tolerable for larger size patients.

FOURTH GENERATION NON-CONTRAST IMAGING
A safe alternative for performing high resolution MRA without the use of contrast agents, delivering images that are often better than those made with conventional contrast imaging.

Vantage
Atlas SPEEDER head coil is available on the Vantage Atlas® and Vantage Titan™ MRI systems.

Non-Claustrophobic Head Imaging
One more option to image claustrophobic patients.

The Atlas SPEEDER™ head coil base is designed to accommodate even the most claustrophobic patients. By scanning with the anterior attachment removed, you can provide increased comfort with a more open view, without having to compromise imaging capabilities.

**ATLAS COIL TECHNOLOGY IMPROVES WORKFLOW**

- Workflow is improved as a result of faster exams due to parallel imaging using Atlas SPEEDER technology
- Patient throughput is enhanced by giving you better success at completing exams with claustrophobic patients
- Revenue is protected by reducing the number of exams refused due to claustrophobia and by reducing the possible need for sedation

Like the complete line of SPEEDER coils, the Atlas SPEEDER head coil is lightweight and designed to yield a high signal-to-noise ratio. Even with the anterior attachment removed, the image quality is excellent giving your claustrophobic patients another option to complete their exams.
